

**Amendments to the Claims**

Claim 1 (original): A computer-implemented method of searching a plurality of queries against at least one database containing a plurality of records, comprising the steps of:

- a. partitioning the plurality of queries into a set of smaller subsets of queries;
  - b. partitioning the at least one database into a set of smaller subdatabases;
  - c. designating searching tasks to be performed by associating each of said subsets of queries with one or more of said subdatabases, assigning each searching task to one of a group of computers operating in parallel, wherein each member of the group of computers operating in parallel has at least one searching task assigned thereto, and executing at least some of the assigned searching tasks using the group of computers operating in parallel; and
  - d. collecting search results from the executed searching tasks and generating a unified search result in accordance with the collected search results;
- wherein the partitioning of the queries and the partitioning of the database are done by one or more members of the group of computers operating in parallel; and
- wherein step c further comprises dividing at least one of the searching tasks into two or more smaller searching tasks, and designating the two or more smaller tasks as related tasks on a virtual shared memory bulletin board.

Claim 2 (cancelled)

Claim 3 (original): The computer-implemented method of claim 1, wherein the partitioning of the queries and the partitioning of the database are based on the processing

capacity of each member of the group of computers operating in parallel.

Claim 4 (original): The computer-implemented method of claim 1, wherein each member of the group of computers operating in parallel assigns to itself which searching tasks it will perform.

Claim 5 (original): The computer-implemented method of claim 1, wherein the plurality of queries are searched against two or more databases.

Claim 6 (original): The computer-implemented method of claim 5, wherein at least one database is not split into a set of smaller databases.

Claim 7 (original): The computer-implemented method of claim 1, wherein at least one of the group of computers operating in parallel performs two or more searching tasks during executing of the searching tasks in step (c).

Claim 8 (original): The computer-implemented method of claim 7, wherein when one of the members of the group of computers operating in parallel finishes a searching task, it assigns to itself another searching task during executing of the searching tasks in step (c).

Claim 9 (original): The computer-implemented method of claim 1, wherein all of the assigned searching tasks are performed by the group of computers operating in parallel.

Claim 10 (original): The computer-implemented method of claim 1, wherein each member of the group of computers operating in parallel is identical.

Claim 11 (original): The computer-implemented method of claim 1, wherein at least two members of the group of computers operating in parallel are different.

Claim 12 (original): The computer-implemented method of claim 1, wherein each member of the group of computers operating in parallel has the same operating system.

Claim 13 (original): The computer-implemented method of claim 1, wherein at least two members of the group of computers operating in parallel have different operating systems.

Claim 14 (original): The computer-implemented method of claim 1, wherein failure of one or more of the members of the group of computers operating in parallel does not affect the correctness of the search results.

Claim 15 (original): The computer-implemented method of claim 1, wherein during execution of each assigned task in step (c), a numerical raw score is reported as part of the search result associated with such task, wherein the numerical raw score corresponds to a quantitative measure of a match between the query and the database.

Claim 16 (original): The computer-implemented method of claim 1, wherein production of the unified search result shows speedup.

Claim 17 (original): The computer-implemented method of claim 1, wherein the collecting of the search results and the generating of the unified search result are performed by a single computer.

Claim 18 (original): The computer-implemented method of claim 1, wherein the collecting of the search results and the generating of the unified search result are performed by multiple members of the group of computers operating in parallel.

Claim 19 (original): The computer-implemented method of claim 1, wherein the collecting of the search results and the generating of the unified search result of step (d) is performed by interleaving the search results from the executed searching tasks on the basis of numerical raw scores generated during the executed searching tasks.

Claim 20 (original): The computer-implemented method of claim 1, wherein the total

search to be performed is represented by a rectangular array, wherein each search task assigned to one of the group of computers operating in parallel is represented by adjacent rectangles making up the array, and wherein the total size of the array corresponds to the total search to be performed.

**Claim 21 (original):** The computer-implemented method of claim 20, wherein each column of the array represents one of the sub-databases and each row of the array represents one or more queries.

**Claim 22 (original):** The computer-implemented method of claim 21, wherein a width of at least one column of the array corresponds to a group of one or more sub-databases that can simultaneously be held in memory in one of the group of computers operating in parallel performing one of the searching tasks associated with that column of the array.

**Claim 23 (original):** An apparatus for performing a computer-implemented method of searching a plurality of queries against at least one database containing a plurality of records, comprising:

- a. means for partitioning the plurality of queries into a set of smaller subsets of queries;
- b. means for partitioning the at least one database into a set of smaller subdatabases;
- c. means for designating searching tasks to be performed by associating each of said subsets of queries with one or more of said subdatabases;
- d. means for dividing at least one of the searching tasks into two or more smaller searching tasks, and designating the two or more smaller tasks as related tasks on a virtual shared memory bulletin board;

- e. means for assigning each searching task to one of a group of computers operating in parallel, wherein each member of the group of computers operating in parallel has at least one searching task assigned thereto;
  - f. means for executing at least some of the assigned searching tasks using the group of computers operating in parallel;
  - g. means for collecting search results from the executed searching tasks; and
  - h. means for generating a unified search result in accordance with the collected search results;
- wherein the means for partitioning of the queries and the means for partitioning of the database comprise one or more members of the group of computers operating in parallel.

Claim 24 (original): The apparatus of claim 23, wherein each member of the group of computers operating in parallel is identical.

Claim 25 (original): The apparatus of claim 23, wherein at least two members of the group of computers operating in parallel are different.

Claim 26 (original): The apparatus of claim 23, wherein each member of the group of computers operating in parallel has the same operating system.

Claim 27 (original): The apparatus of claim 23, wherein at least two members of the group of computers operating in parallel have different operating systems.

Claim 28 (original): The apparatus of claim 23, further comprising means for compensating for failure of one or more of the members of the group of computers operating in parallel, wherein said failure does not affect the correctness of the search

results.

Claim 29 (original): The apparatus of claim 23, wherein the means for executing at least some of the assigned search tasks further comprises means for reporting a numerical raw score as part of the search result associated with such task, wherein the numerical raw score corresponds to a quantitative measure of a match between the query and the database.

Claim 30 (original): The apparatus of claim 23, wherein the means for collecting of the search results and the means for generating of the unified search result of step comprises means for interleaving the search results from the executed searching tasks on the basis of numerical raw scores generated during the executed searching tasks.

Claim 31-32 (cancelled).
